

# GEOGRAPHIC DISTRIBUTION

## VON WILLEBRAND DISEASE

This data was provided to us by the CDC and is up-to-date as of May 2017. However, the NIH estimates that between 1 and 100, and 1 and 10,000 people have von Willebrand's Disease (VWD), and that is often underdiagnosed.\* Most agree that vWD is the most common genetic bleeding disorder and many do not go to Hemophilia Treatment Centers for care.

Geographic distribution of persons with von Willebrand disease attending federally funded integrated-care Hemophilia Treatment Centers by state of residence, 1/2012-12/2016

Note: This map presents the number of individuals who attended the hemophilia treatment centers (HTCs) during the period 1/1/2012-12/31/2016 and who were entered into the HTC Population Profile (<https://www.cdc.gov/ncbddd/hemophilia/communitycounts/about.html>) as of 12/31/2016. Individuals are counted only once, regardless of the number of times they attended an HTC during this period.

Finalized May 18, 2017
